Ministry of Transportation

Transportation Technology and Energy Branch Public/Private Opportunities in Intelligent Vehicle/Highway Systems (IVHS) – Seminar Presentations

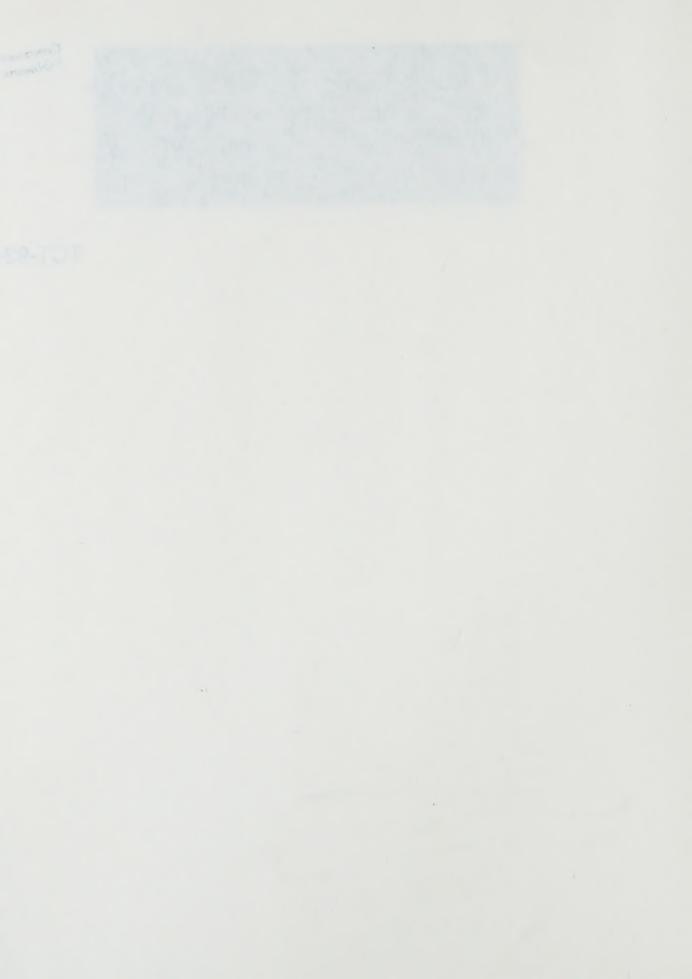

### Public/Private Opportunities in Intelligent Vehicle/Highway Systems (IVHS) – Seminar Presentations

TCT-92-04

### Public/Private Opportunities in Intelligent Vehicle/Highway Systems (IVHS)

Presented by

Ministry of Transportation of Ontario and

Ministry of Industry, Trade and Technology

August 25, 1992

Harbour Ballroom
The Westin Harbour Castle
Toronto, Ontario

Ministry of Transportation Transportation Technology and Energy Branch

Ministry of Industry, Trade and Technology

Digitized by the Internet Archive in 2024 with funding from University of Toronto

### CONTENTS

PROGRAM1
ATTENDEES
PRESENTATIONS
Canadian Initiatives (L. Strasberg)
International IVHS Activities (E.R. Case)
Access to the U.S. Market (K. Bebenek)
International Marketing (D. Grovestine)
Guidelines for Successful Public/Private Collaborative Ventures (E. Rule) 96
The Development of Freeway Traffic Management Systems
in the Province of Ontario (P. Masters)
IVHS Overview (G. Heti)
TravelGuide Ontario's Low-Cost Route Guidance and
Traveller Information System Concept (G. Heti)
International IVHS Standards Development (J. Wang)
Commercial Vehicle Operations (J. Tsai)
Advanced Public Transportation Systems (B. Pekillis)

# PUBLIC/PRIVATE OPPORTUNITIES

Z

# INTELLIGENT VEHICLE/HIGHWAY SYSTEMS

# CANADIAN INITIATIVES

L. STRASBERG

P.ENG.

MINISTRY OF TRANSPORTATION OF ONTARIO

TRANSPORTATION TECHNOLOGY & ENERGY BRANCH

August 25, 1992

## CANADIAN INITIATIVES

# BROAD CANADIAN INITIATIVES FOCUS AROUND:

- o TAC (Transportation Association of Canada)
- o IVHS Roundtable
- o Working Group on Communications for IVHS
- Transportation) GIS-T (Geographical Information System - for 0
- o Vision 2000
- o CITE (Canadian Institute for Transportation Engineers)

# IVHS ROUNDTABLE - MEMBERSHIP

o Formed a Few Years Ago to Keep Abreast of

(Mainly) US Developments

o Feds & Ontario Prominent

o Now Under Auspices of TAC

The Following Have "Formally Joined", Attended Meetings 0

And/Or Signalled Their Intention To Become Members:

(AN INCOMPLETE LIST)

o Federal Government

Transport Canada

Department of Communications

National Research Council

o Provincial Ministries of Transportation

# IVHS ROUNDTABLE - MEMBERSHIP

- Canadian Trucking Association
- o Ontario Trucking Association
- Canadian Automobile Association
- o Vision 2000
- o CMAC / CTAC (Manufacturing/Electronics)
- o (CUTA) Canadian Urban Transit Association
- Regional Municipality of Ottawa/Carleton
- Consultants
- o Universities

# IVHS ROUNDTABLE - ACTIVITIES

- o Dissemination of Information
- o Sponsoring of Seminars, Workshops
- o Facilitator of Activities
- o Liaison for International Activities
- o Provision of "Brokerage" Services
- o Information Exchange
- o Networking

### **ACTIVITY CENTRES**

o Developing Around

Ontario

Quebec

Saskatchewan

Alberta

**British Columbia** 

Nova Scotia

### C - HELP

Canadian Heavy vehicle Electronic Licence Plates

o Using AVI, AVC and WIM Technologies

Automatic Vehicle Identification

Automatic Vehicle Classification

Weigh In Motion

Joint Program with U.S.

0

o Canadian Suppliers Involved

### SCOOT INITIATIVES

- o An Advanced Traffic Management System
- o Split Cycling Offset Optimization Technique
- o Demonstration/Pilot Projects in

Red Deer, Alberta

Halifax, Nova Scotia

Toronto, Ontario

## ONTARIO INITIATIVES

- o Several will be Presented Later
- o Some Additional Ones
- o INTEGRATION for TRAVTEK, Troy, others
- RTMS (Road Traffic Microwave Sensor)

0

- o Corridor Management Lakeshore/QEW/427
- o SCOOT
- o Transit Telerider; Precursor/Smart Card
- o Industry Vapor/HELP

## INITIATIVES IN QUEBEC

- o Gestions des Corridors Autoroutiers
- A Traffic Management System for Autoroutes around Montreal 0
- o \$26 m
- System Still requires Cameras, more Loops, TOC and Communications 0
- Systeme de Gestion de la Circulation sur les Ponts de Quebec et Pierre La Porte 0
- Reversible Lanes on One of Two Bridges Leading into Quebec 0

## INITIATIVES IN QUEBEC

- Human Factors and System Studies Related to Advanced Transportation Systems 0
- o Signing (Electronic Signs)
- Risk and Compensation (Liability Issues)
- o Advanced Tools and Methods
- GIS System Using GPS Receivers in Police Cruisers 0
- Electronic Data Base for Truckers (Road Information) 0
- o Simulation Tool for Driver Training
- o Transit
- o University of Montreal Research
- o Industry.
- o Vapor Tags for HELP ("Now" Mississaugua)
- o GIRO Software for Transit

# INITIATIVES ON THE PRAIRIES AND IN THE WEST

- o Alberta
- University of Alberta
- Research; Consulting
- o Saskatchewan
- IRD Supplier of WIM's for HELP

(Including USA)

- o British Columbia
- **HELP Participant**
- Massey Tunnel

### VISION 2000

" ... to Accelerate the Development and Exploitation of 0

New Technologies for Advanced Personal Communications"

o DOC "Driven"

o Had Involvement with:

CMAC (Microelectronics)

CTAC (Telecommunications)

**IVHS Roundtable** 

# WORKING GROUP ON COMMUNICATIONS FOR IVHS

- o Under Auspices of Roundtable
- o DOC/MTO/TC
- Interface with IVHS America

0

o Next Meeting - MTO, 09 Sep

### GIS - T

- Geographical Information System for Transportation 0
- Canadian Initiatives May Come Under Auspices of Roundtable 0
- EMR Pilot Project for Road Transportation Database 0
- MTO As Part of MTIPS (Real Time Traffic Information Pilot)

0

- Metro Ambulance (Toronto) Advanced Research and some Deployment 0
- Coordination Beginning/Committee Being Formed 0

### VNIS 93

- o Ottawa 1993
- o Involvement By:
- TAC/Roundtable
- CITE (Canadian Institute of Transportation Engineers)
- MTO/TC
- o Founding Conference: VNIS 89 MTO/TC
- Other Conferences in Detroit, Michigan; Oslo, Norway 0

### CONCLUSIONS

- o Several Activities Already Underway
- Many Are Being Formed

0

- o New Technologies Herald Opportunity
- o See List of "Contact Points"

### INTERNATIONAL IVHS ACTIVITIES

Public/Private Opportunities
in
Intelligent Vehicle/Highway Systems (IVHS)

presented by
E. Ryerson Case
E.R. Case & Associates

August 25, 1992

### **Overview**

### Will cover:

- Europe
- Japan
- United States

### Will focus on:

- Major actors in IVHS
- Major programs
- Public/private partnerships
- Institutional arrangements

### Reference -

Canadian IVHS Roundtable Synopsis Report (available soon)

### Europe

Major Actors in RTI/IVHS
(RTI - Road Transport Informatics)

- European Community (EC)
  - 12 Common Market States
  - Administered by Commission of European Communities (CEC)
  - DRIVE is their most important IVHS/RTI program (Dedicated Road Infrastructure for Vehicle Safety in Europe)

### Eureka

- Europe's response to the US SDI Program
- 3 RTI projects accepted:
  - \* PROMETHEUS (Program for European Traffic with Highest Efficiency and Unprecedented Safety) most important
  - \* CARMINAT driver information and navigation system
  - \* DEMETER digital map exchange standard

Major Actors in RTI/IVHS (cont'd)

- European Conference of Ministers of Transport (ECMT)
  - Represents all European countries
  - Mainly concerned with setting RTI standards for Europe - digital maps, communications (e.g. RDS-TMC), etc.
- ERTICO
   (European Road Transport Telematic Implementation and Coordinating Organization)
  - Public/private organization promoting RTI in Europe
  - Similar role as IVHS America in the US
  - Recently formed, with EC encouragement

### **DRIVE I**

- 3 year pre-competitive research program (ended in '91)
- \$150 M, 60 projects highly successful
- Consortia from government, industry and research institutions
- Cost shared 50/50 government/industry
- Open tender requiring participation of at least two independent partners from different countries, one from industry
- Non-EC participation allowed but with no EC funding

### **DRIVE II**

- Advanced Transport Telematics (ATT) Program
- 3 years, \$250 M, starting Jan. '92
- Emphasis on pilot projects based on DRIVE I results
- Field trials in 20 cities and 2 major corridors (Paris-London, Lyon-Stuttgart)
- Functional areas being evaluated:
  - automatic debiting
  - demand management
  - smart cards applications
  - traffic information
  - electronic data interchange
  - urban traffic control
  - route guidance
  - traffic control and route guidance

### **PROMETHEUS**

- 7 year, \$800 M program
- Private sector initiative
- Started by 18 European auto companies in 1986 now more
- Safety a key element (goal 50% casualty reduction by year 2000)
- 11 member steering committee industry membership only
- "Council" membership from government and research institutes
- Pro-competitive R&D only free competition thereafter
- Combines applied research (by industry) and basic research (by 40 universities and research institutions)
- Common European Demonstrators (CEDs)

### **PROMETHEUS Common European Demonstrators**

To evaluate developments in 10 key areas:

- 1. Vision enhancement
- 2. Proper vehicle operation
- 3. Collision avoidance
- 4. Co-operative driving
- 5. Autonomous intelligent cruise control
- 6. Emergency systems
- 7. Commercial fleet management
- 8. Test sites for traffic management
- 9. Dual mode route guidance
- 10. Travel information systems

### **Major Actors in IVHS**

### **Japanese Government:**

- Ministry of International Trade and Industry (MITI)
  - Industrial Science and Technology Agency
- Ministry of Construction (MC)
  - Japan Highway Public Corporation interurban expressways
  - Metropolitan Expressway Public Corporation urban expressways
- National Police Agency (NPA)
  - Responsible for all TCS's in Japan except for expressways
  - ATCS 160 systems, standardized throughout Japan
- Ministry of Posts and Telecommunications (MPT)
  - Regulatory responsibility frequency allocation, etc.

Major Actors in IVHS (cont'd)

### **Public/Private Associations:**

- Japan Traffic Management Technology Association (TMT)
  - Under National Police Agency
  - MPT collaboration
  - 60 companies
  - Responsible for CACS, RACS, SSVS and PVS
- Association of Electronic Technology for Automobile Technology and Driving (JSK)
  - Under MITI
  - NPA and MC collaboration
  - 57 companies
  - Responsible for ATCS and AMTICS
  - Digital Road Map Association (DRMA)
    - Under MC
    - Many companies
    - Standard map database for IVHS applications in Japan
  - Highway Industry Development Organization (HIDO)
    - Created by MC
    - Over 300 companies
    - Involved in CACS and RACS

### **Major IVHS Projects:**

- Advanced Mobile Traffic Information & Communications System (AMTICS)
- Road Automobile Communications System (RACS)
- Super Smart Vehicle Systems (SSVS)
  - Coordinated by MITI
  - 20 30 year horizon
  - 3 major universities
  - 20 major automobile (incl. Volvo & M-Benz) and electronics companies
- Person Vehicle System (PVS)
- Next Generation Highway Traffic System (NeGHTS)

### **Current Developments:**

- Vehicle Information and Communications System (VICS) Program
  - Under MC, NPA and MPT
  - To resolve the RACS versus AMTICS problem
  - Reach consensus on a driver information and routing system for implementation throughout Japan in this decade
  - 400,000 in-vehicle navigation systems have been sold in Japan
- Liaison Council for IVHS/RTI Japan
  - Members JTMTA, HIDO and JSK
  - To play liaison role in IVHS/RTI in Japan

### Some Observations:

- MITI has played a vital long-range role in nurturing development
- Projects provide opportunity for many players from industry and research institutions
- Willingness to proceed with plausible projects to learn by doing
- Public/private collaboration served their respective goals
- Commercial success of in-vehicle navigators encouraging implementation

### Major Actors in IVHS

### **Government:**

- US Department of Transportation
  - Federal Highway Administration (FHWA)
  - Federal Transit Administration (FTA)
  - National Highway Traffic Safety Administration (NHTSA)
- State DOTs
  - CA, MI, MN, TX, IL, FL, WA, AZ, NY, etc.
- Counties
  - Oakland, MI; etc.
- Cities
  - Los Angeles

Major Actors in IVHS (cont'd)

### **Associations:**

- Intelligent Vehicle-Highway Society of America (IVHS America)
- Highway Users Federation
- American Automobile Association (AAA)
- American Trucking Association (ATA)
- American Association of State and Highway Transportation Officials (AASHTO)

Major Actors in IVHS (cont'd)

### **State Programs:**

- PATH Program California
  - Program on Advanced Technology for the Highway
  - Caltrans and UC Berkeley
  - 70 projects, budget about \$17 M
  - Full range of IVHS technologies, emphasis on clean air and full highway automation
- UMTRI Program Michigan
  - Univ. of Michigan Transportation Research Institute
  - Partnership U of M, MI DOT, FHWA, Industry
  - Focus on ATMS and ATIS
  - Comprehensive IVHS graduate program

Major Actors in IVHS (cont'd)

### **State Programs:**

- GUIDESTAR Minnesota
  - Cooperative program
  - U. of Minnesota, MN DOT, FHWA, Industry
  - Focus on ATMS, ATIS, and Fleet Management
  - Pioneered video detector

### ENTERPRISE

- Cooperative program
- AZ, CO, IO, MI, MN, WA, ON, FHWA, TC
- Private sector consultants, auto and electronics industries
- To facilitate development and implementation
- Share experience and avoid duplication

### **Operational Tests**

- 9 involving ATMS
- 6 involving ATIS
- 2 involving Commercial Vehicle Operations

### **IVHS America**

- Non-profit organization est. Jan. '91
- Membership from industry, all levels of gov't, associations, agencies, universities, individuals, from all countries
- Goals:
  - Be focus for IVHS community in North America
  - Recommend standards, specs and protocols for N.A.
  - Foster research
  - Promoted international cooperation
  - Advise US DOT on IVHS

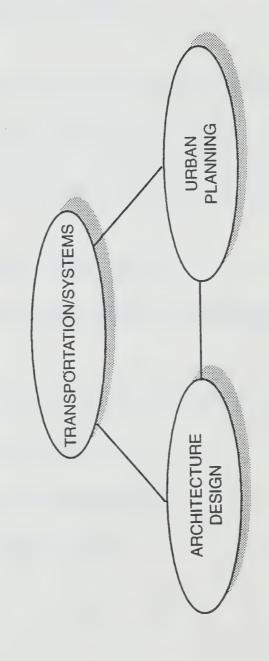

### IVHS America (cont'd)

- Strategic Plan
  - Formally presented to US DOT
  - Guide for implementation of IVHS in the US
- Canadian Representation
  - MTO, MTQ, and TAC are member organizations
  - Sit on Board of Directors
  - Individual memberships

### The Intermodal Surface Transportation Efficiency Act of 1991

- ISTEA-91 Determines distribution of Federal-Aid Funds
- Funding \$155 B over 6 year period
  - Highway Trust Fund past/future highway user fees
  - General Fund from taxes
  - Generally provides 80% matching funds
- Intelligent Vehicle Highway Systems Act
  - \$660 M over 6 years
  - \$500 M for IVHS corridors
  - \$158 M for IVHS R&D

### IBI GROUP

### • 18 YEARS OF PROFESSIONAL PRACTICE

### • OVER 250 PEOPLE ACROSS NORTH AMERICA

### **IVHS ACTIVITIES - ONTARIO**

- EXPERIENCE DATING TO EARLY 1980'S
- ATMS DEVELOPMENT AND IMPLEMENTATION
  - QEW BURLINGTON SKYWAY
  - QEW MISSISSAUGA
  - HIGHWAY 401 COMPASS
- GARDINER-LAKE SHORE CTMS

### U.S. OPPORTUNITIES IN IVHS

### 1991 INTERMODAL SURFACE TRANSPORTATION EFFICIENCY ACT (ISTEA)

- \$155 BILLION PROGRAM OVER 6 YEARS
- \$660 MILLION FOR IVHS RESEARCH AND DEMONSTRATION
- RELATED PROGRAMS e.g. OTHER TRANSIT AND MOTOR CARRIER INITIATIVES

**IVHS AMERICA** 

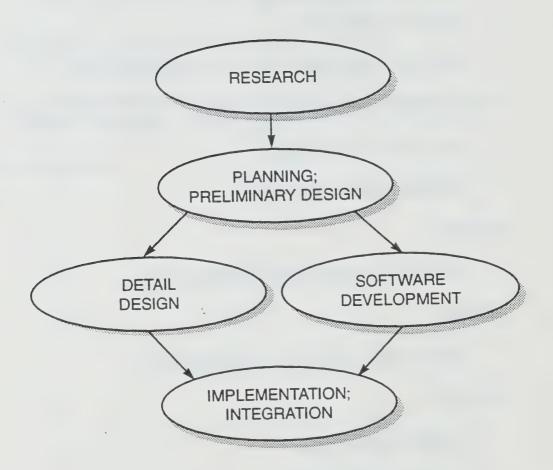

### U.S. IVHS MARKET

### THE CLIENTS...

- FHWA
  - R&D; STANDARDS
  - 80% OF FUNDING FOR STATE INITIATIVES
- MULTI-STATE PROJECTS
  - e.g. HELP, CRESCENT
  - OPERATIONS ORIENTED
- STATES
  - FREEWAY, AREA-WIDE OPERATIONS
- LOCAL
  - AREA-WIDE IVHS PLANNING/DEMOS
- PRIVATE
  - ELECTRONIC TOLL
  - FLEET OPERATORS

### **US IVHS MARKET**

### SERVICES REQUIRED...

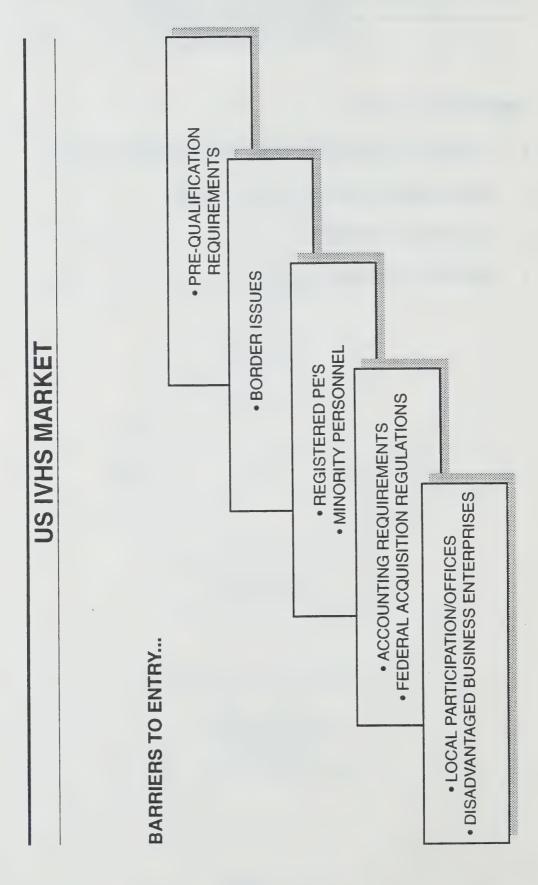

### POTENTIAL ROLE AS:

- CONCEIVER
- DESIGNER
- IMPLEMENTOR

### U.S. IVHS MARKET

### OTHERS IN MARKET...

- LARGE TRANSPORTATION ENGINEERING FIRMS
- SPECIALIZED IVHS CONSULTANTS
- INDIVIDUAL EXPERTS
- DEFENCE CONTRACTORS

### IBI GROUP APPROACH

### FINDING THE WORK...

- TRADE JOURNALS
- BULLETINS
- CONFERENCES
- CLIENT RELATIONSHIPS
- TEAM RELATIONSHIPS

TYPICALLY RFP ENVIRONMENT

### IBI GROUP APPROACH

### **PURSUING WORK...**

- RESPONSE TO RFP USUALLY REQUIRES ALLIANCE:
  - LARGE U.S. FIRMS NEEDING IVHS NICHE
  - U.S. IVHS FIRMS NEED NICHE e.g. SOFTWARE
  - LOCAL DBE REQUIREMENT
- AS EXPERIENCE BUILDS, INCREASING ROLE AS PRIME

### IBI GROUP APPROACH

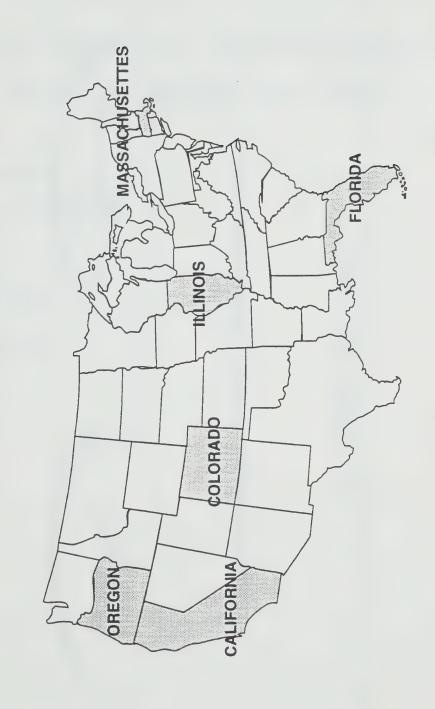

### **UPON AWARD...**

- COMMITMENT OF STAFF MEMBERS
- SEEK REGISTRATION
- ALLOCATION OF SENIOR MANAGEMENT
- IMPLEMENTATION OF PROJECT OFFICE AS REQUIRED

### IBI GROUP EXPERIENCE US IVHS PROJECTS

	ATMS	ATIS	cvo	APTS
BOSTON CA/T	•			
IRVINE TRAFFIC MANAGEMENT AND OPERATIONS STUDY	•	•	•	•
CALTRANS TALKING LOOP PROJECT		•	•	•
CALTRANS CCTV AND COMMUNICATIONS	•			
ORLANDO 1 - 4 SOFTWARE	•	•		
ILLINOIS ADVANCE IVHS DEMONSTRATION	•	•		
PORTLAND	•			
COLORADO	•			

### IBI GROUP EXPERIENCE US IVHS PROJECTS

### **EXPANDED HORIZONS**

## IBI GROUP INTERNATIONAL PROJECT EXPERIENCE

QUITO, ECUADOR
• SIGNAL STUDY

RIYADH, SAUDI ARABIA

• SMART CORRIDOR DESIGN

GLASGOW, SCOTLAND

• REPLACEMENT OF CITRAC

• DRIVER INFORMATION

PROJECT

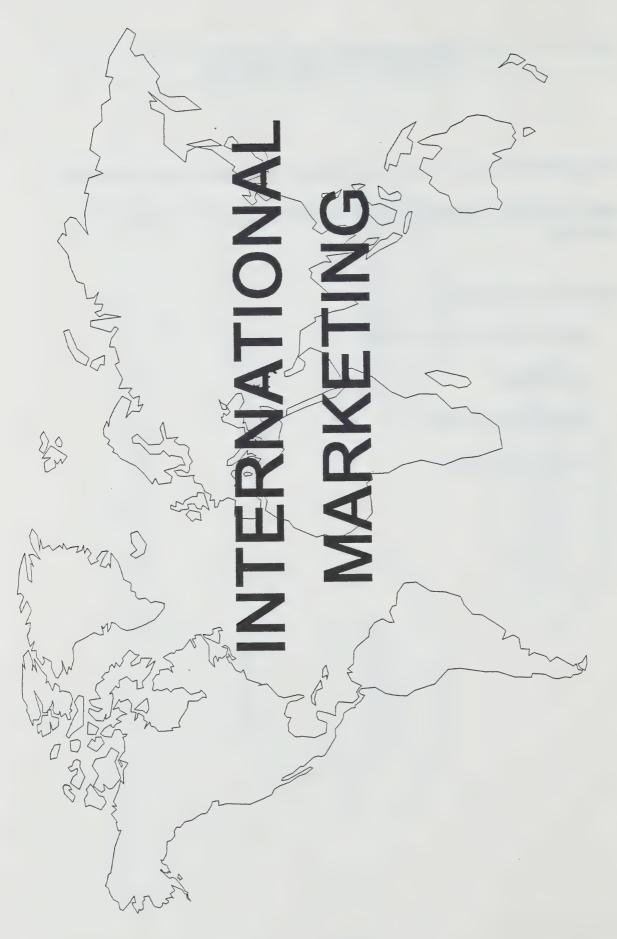

### **FUTURE DIRECTIONS**

PROLIFERATION OF "OFF-THE-SHELF" INTEGRATED SYSTEMS,

MARKETED BY CONSORTIUMS PROVIDING FULL TURNKEY
SERVICE

### **CANADIAN EXPERTISE**

- ENGINEERING SERVICES
- ACADEMIA
- MANUFACTURERS
- PUBLIC SECTOR

## What does the ideal public-private collaborative venture look like?

Example	A business plan is in place	Relationships are more important than titles	Semi-annual briefings held	Public sector partner typically acts as a customer and/or banker	Spar Aerospace, Integration
Factor	Expectations are clear over a multi-year period	Continuity is maintained in liaision staff	Progress is monitored and reported periodically	Partners should stay out of day-to-day management	Alliance is mutually beneficial

### THE DEVELOPMENT OF FREEWAY TRAFFIC MANAGEMENT SYSTEMS

### IN THE PROVINCE OF ONTARIO

### 1. INTRODUCTION

Freeway Traffic Management Systems (FTMS) were originally developed in the United States in the early 1960's. Within the Ontario context, Freeway Traffic Management can be defined as a system for managing the traffic flow on freeways in order to obtain the maximum use of the freeway system under varying roadway and traffic conditions.

The basic objective of a freeway traffic management system is to minimize the detrimental effects associated with both recurring and non-recurring congestion. These effects include travel delays, accidents, air pollution and energy consumption.

Recurring congestion is caused by a traffic demand volume in excess of the roadway's capacity. This type of congestion is relatively predictable and usually occurs during the peak periods at approximately the same location and same time.

Non-recurring congestion is caused by "randomly" occurring incidents (i.e. accidents, breakdowns, etc.) which lead to a reduction in roadway capacity. The reduction in capacity is further compounded by the "rubber-necking" factor: there is a tendency among motorists to slow down to view the incident. For example, for a three lane freeway cross-section, an incident which is entirely on the shoulder will still reduce throughput by 15%. An incident that blocks one lane will reduce throughput by 44%. Approximately 60% of the congestion delay on the Greater Toronto Area freeway network is due to recurring congestion.

Freeway Traffic Management Systems are typically considered for busy urban freeways which already have significant congestion problems or have a clear potential for severe congestion in the future. Despite growing traffic demands on the Province's urban freeways it is often not financially possible or socially acceptable to implement major capacity improvements. Instead, the Ministry of Transportation must "manage" each facility in order to maximize its utility.

A properly designed and implemented freeway traffic management system can yield significant quantifiable benefits in the form of reductions in delay, accidents and fuel consumption. Some of the less tangible benefits include a reduction in vehicle emissions, improved traffic data collection, reduction in driver frustration and the encouragement of technological development.

### 2. FREEWAY TRAFFIC MANAGEMENT SYSTEMS IN ONTARIO

### i) QEW Mississauga FTMS

The QEW Mississauga FTMS was begun in 1975 as a project to demonstrate the principles of freeway traffic management. The original system covered the eastbound lanes of the QEW between Southdown Road and Highway 10 and concentrated on dealing with the congestion bottleneck that occurred at Highway 10 during the morning peak period. The system included detector loops, closed circuit television cameras, ramp metering and a two-line changeable sign near Southdown Road. The system produced a 21% reduction in vehicle hours of travel, a 45% increase in average speeds and a 22% reduction in collision experience in the demonstration area during the peak periods.

Since that time, the Mississauga system has been expanded to cover the eastbound QEW between Royal Windsor Drive and Hwy 427 and also a portion of the westbound QEW. The system includes full detector and CCTV coverage, 10 metered ramps and 3 changeable message signs. The system is operated 16 hours/day from a renovated bungalow near the Highway 10 interchange.

### ii) Burlington Skyway FTMS

The QEW Burlington Bay/James N. Allan Skyway FTMS was originally justified as a traffic management tool during the extensive reconstruction and rehabilitation activities that took place in the area throughout the 1980's. The system came into operation in 1985. The system allows traffic to be monitored on both skyways and on a parallel arterial road which crosses over a lift bridge. The parallel arterial road is equipped with signal pre-emptions and special blank-out signs which can be activated to accommodate additional traffic that may need to be diverted from one of the skyways. Outlying blank-out signs are also used to communicate with drivers. The system is operated from the MTO Burlington District Office and has direct communications links with the Ontario Provincial Police (O.P.P.) the media and the lift bridge operator.

Despite an 8% increase in traffic volumes in this corridor during 1986, an almost 30% reduction in accidents occurred, which is largely attributable to the Burlington FTMS.

### iii) Highway 401 FTMS-COMPASS

The Highway 401 through the Greater Toronto Area is one of North America's busiest freeways, with some sections carrying in excess of 325,000 vehicles per day. The Highway 401 FTMS is by far the most complex traffic management system ever implemented in Ontario. The initial system is 16 km in length, from Yonge St. to Martin Grove Road with full detector and CCTV coverage. The system focuses on Incident Management and Motorist Advisory strategies.

### 3. FTMS STRATEGIES

Most FTMS (freeway traffic management systems) employ four basic strategies.

### i) Incident Detection and Confirmation

Before any type of management strategy can be employed it is essential that there is reliable, accurate and timely information on roadway and traffic conditions. The primary means of detection in an FTMS is through the use of wire loop detectors embedded in each driving lane of the pavement at approximately 500 m intervals. These loops are continuously detecting vehicle movements and the information is compiled at a roadside microprocessor. The information is summarized and relayed at frequent intervals to a central computer via a communications system. The central computer at the traffic operations centre analyzes the data and checks for irregularities in traffic flow. Any potential problem locations are indicated to the operator.

There are presently 66 vehicle detector stations operating on Hwy 401 between Martin Grove Road and Yonge Street. These stations contain a total of 660 loop detectors. Vehicle detector stations cost approximately \$45,000.00 per station for the purchasing and installation of all of the field components.

The operator confirms the location and severity of problem with the aid of the closed circuit television (CCTV) subsystem. Closed circuit television cameras are mounted on 15 m concrete poles and located adjacent to the freeways at 1 km intervals. These cameras can be remotely controlled from the control centre to zoom, focus, pan and tilt. Once the operator has verified the problem, an appropriate response must be implemented.

Thirty two CCTV installations are presently in operation between Renforth Road and Warden Avenue on Hwy 401. Each station costs about \$40,000.00.

### ii) Incident Management

Incidents account for a significant portion of the congestion in the Greater Toronto Area and at present the greatest potential for reductions in delay will result from improved incident management techniques. For each minute of incident duration (the time from occurrence until clearance) between four to ten minutes of resulting delay are produced (e.g. for an incident lasting fifteen minutes, a minimum of one hour of congestion will result). The average incident duration for the Greater Toronto Area is in excess of thirty minutes. In addition, incidents on busy freeways have a great potential to cause what may be called "secondary" accidents. These "secondary" accidents are typically sideswipes or rear-end collisions with the congestion queue or incident site.

As a result, the emphasis is on the operator responding in a timely and comprehensive fashion to an incident in order to reduce both the exposure and duration of the incident. For commonly occurring incidents, response plans are often prestored in the central computer. A typical response plan includes notification of the police/emergency services, notification of towing/clearance services, and implementation of advisory and possibly flow management strategies (see following sections). Most incidents require ongoing monitoring of the situation and adjustments to the traffic management strategies.

Successful Incident Management requires not only the timely transmission of accurate information but also a well-developed working relationship with the various agencies involved. Careful planning and co-ordination is necessary in order to minimize the duration of the incident and maximize safety for the responding personnel and the motorists.

Recent developments in the techniques for incident management include; more aggressive policies on vehicle clearance; the provision of contract towing services; the provision of appropriate incident management equipment (e.g. portable changeable signs); the development of off-highway accident investigation sites and regular inter-agency planning/evaluation meetings.

### iii) Motorist Advisory

A key ingredient for successful traffic management is the ability to advise motorists both prior to and during their trips. The traffic operations centre gathers then disseminates information to the media and other agencies/users. This information includes not only scheduled construction and maintenance activities but also "real-time" information relating to incidents. Media services have the opportunity to receive faxes directly from the FTMS operations centre and receive virtually real-time updates.

Once the motorist is on the roadway, the most dependable means of conveying information is through the use of changeable message signs. The type of sign can range from a simple "blankout" sign to a large dot matrix sign which can display graphics and three lines of text. The signs are usually strategically located so as to inform motorists prior to making a routing decision, or to provide cautionary information prior to entering an area of congestion or accidents.

Motorist Advisory strategies can help to influence route choice, which in turn can help to reduce traffic demand on an already congested freeway. By preparing drivers as they approach an area with adverse traffic conditions, "secondary" type accidents can be reduced. In order for Motorist Advisory strategies to remain effective, it is important that any information released be timely and accurate. Once an Operating Agency's credibility is lost, it takes a long time to restore it.

Presently there are 13 Changeable Message Signs on Hwy 401 between Martin Grove Road and Yonge Street. These signs, manufactured in Ontario, are the largest, most complicated CMS installed in North America to date. These signs employ clusters of green and red L.E.D.'s to form the display matrix and have a graphics capability. The signs and associated field controller, cabinets and trusses cost \$400,000.00 per installation.

Several other technologies are now emerging which can only enhance the Motorist Advisory strategies. Pre-trip information can be disseminated by automated telephone answering systems, computer bulletin boards and Cable T.V. feeds. In-car information can be provided by cellular phone information services and Highway Advisory Radio (HAR).

### iv) Flow Management and Control

By regulating the amount of traffic entering the freeway it is possible to optimize the freeway traffic flow and as a result operate the facility at maximum efficiency. Ramp Metering is the most common means of attempting to optimize freeway flow. Ramp metering also reduces the amount of turbulence created by vehicles entering the freeway and as a result reduces accident rates.

A properly designed ramp metering installation is extremely cost-effective and results in net travel time savings for the majority of the freeway users, including those who must wait in the queues on the ramps. Implementation of a ramp metering system must be approached very carefully, with extensive consultation with local politicians and the public. At present, ramp metering is only being used on the eastbound QEW through Oakville and Mississauga.

### 4. COMMUNICATIONS SYSTEM

All of the field equipment in an FTMS must be connected back to the central computer. In the Hwy 401 System this is done by using a state-of-the-art fibre optic communications system. This system is a full fibre system using fibre optics for both trunk communications and low speed connections between trunk nodes and the field equipment. Hwy 401 is the first system in North America to use this type of fibre optics network. The communication network on Hwy 401 cost approximately \$200,000.00 per kilometer.

### 5. OPPORTUNITIES FOR CANADIAN COMPANIES

### i) Development

Development is required in a number of areas related to FTMS. Vehicle detection equipment is the primary area. The existing loop technology has been in use for many years. This technology has definite limitations and is difficult to tune or repair. New technology to detect vehicles, especially methods that do not require embedding in the road are needed.

Other possible areas of development include incident detection algorithms, used to determine when traffic conditions indicate possible incident conditions, closed circuit TV technology, changeable message sign technology and communication systems. Some development work is presently proceeding in all of these areas.

ii) There are a number of areas associated with FTMS where companies can get involved with the MTO on a partnership basis as follows:

### a) Information Collection and Dissemination

Information dissemination to the public is an important component of FTMS. MTO presently distributes information to the media by computer generated fax from a database of incidents the operations centre is aware of. Partnerships could be formed to develop other dissemination methods including Highway Advisory Radio, text to speech from our incident database, and distribution by paging systems, etc.. Improvements to the information gathering process could also be considered through exchanges of information with media and others who have additional incident data.

### b) Incident Management

Although many of the activities undertaken to manage incidents are undertaken by public agencies there is room for partnerships in the areas of provision of courtesy service to the public, provision of towing service, removal and storage of abandoned vehicles and efforts with insurance companies in the whole area of accident investigation, vehicle removal, selection of auto body shops and pounds for accident vehicle storage.

### WHAT IS IVHS

Applications of advanced technologies to:

increase mobility

improve transportation productivity and efficiency

reduce pollution

enhance safety

by treating as a system:

· vehicle

roadway and

control centres

### **EXAMPLES OF IVHS**

- Freeway and Traffic Management Systems
- Driver Route Guidance Systems
- Vehicle Location and Management Systems
- Commercial Vehicle System Automation
- Automatic Toll Collection Systems
- Collision Avoidance Systems

## **BENEFICIARIES OF IVHS**

Public

Transportation Industry

Transportation Agencies

High Technology Industries

### IVHS CATEGORIES

APTS - Advanced Public Transportation Systems ATMS - Advanced Traffic Management Systems ATIS - Advanced Traveller Information Systems CVO - Commercial Vehicle Operation Systems AVCS - Advanced Vehicle Control Systems

### WHAT'S HAPPENING

- Worldwide recognition of IVHS importance
- THE Major Transportation Program in the US
- IVHS America established 1991
- Six year, \$600 Million commitment to RD&D
- Europe active with government/industry programs
- Japan concentrating on in-vehicle systems Canada active in IVHS America
- Transport Canada active player
- Ontario has a strong program

### WHAT'S ANTICIPATED

- \$200 BILLION over 20 years for IVHS in North America
- 80% purchased by private sector
- 40% of automobile value in electronics in 10 years
- Competition with Europe, Japan
- North American standards/systems
- Electronic license plates/smart cards
- Automated highways

### WHO IS DOING WHAT

- Government/Industry Setting IVHS Agenda
- US Congress providing \$600 M funding
- Major industries pursuing commercialization
- Motorola
- General Motors
- Telesat Canada
- New industries & new products emerging
- Demonstration projects under way in US, Canada
- Canada setting up IVHS Roundtable
- Canadian companies supplying leading products

# MAJOR NORTH AMERICAN PROJECTS

- Route Guidance/Traveller Information Systems
- Smart Corridor Los Angeles
- TravTek Orlando
- · Advance Chicago
- · TravelGuide Ontario
- Commercial Vehicle Automation
- HELP/Crescent West Coast

### **KEY TECHNOLOGIES**

- Communications
- · Short range
- · 1 and 2-way with vehicles
- Electronics
- Vehicle Identification
- Vehicle Location
- Collision Avoidance
- **Control Systems**
- · Computers
- Mapping and GIS
- System Integration & Software Development

## WHAT ONTARIO IS DOING

- · Active in Canadian IVHS Roundtable
- Active in IVHS America
- Partner in early US Demonstrations:
- ENTERPRISE
- 1-75
- Border Crossing Automation

# WHAT ONTARIO IS DOING (cont)

- Many Ontario projects under way:
- Traveller Information Systems
- Wide Area Vehicle Monitoring
- Transit automation
- **Automated Truck Clearance**
- Freeway Traffic Management

## WHAT SHOULD CANADA DO

- · Establish own agenda IVHS Roundtable
- Get funding to pursue Canadian program
- · Participate actively in IVHS America to:
- · Set standards and direction
- · Participate in US projects
- Form alliances
- Advertise Canadian capabilities
- Stay current
- Identify and pursue industrial opportunities
- Demonstrate successes and benefits
- Pursue international opportunities

# ATIS - ADVANCED TRAVELLER INFORMATION SYSTEMS

Systems to collect and disseminate real time information regarding the transportation network that allow road and transit users to:

- Learn about traffic conditions
- Find their way in new surroundings
- Find the best route to their destinations
- · Get information on transit schedules
- Receive services over 1-way and 2- way communication networks

### **ATIS EXAMPLES**

- Pager type traffic data receivers
- Portable route guidance devices
- In-vehicle location and guidance systems
- · Terminal map displays showing traffic congestion
- Terminal based route advisories
- · Changeable message sign advisories

## POTENTIAL ATIS BENEFITS

- Advance knowledge of trip duration
- Trip routing and guidance
- Congestion avoidance
- Shorter trip times
- Reduced cost of travel
- Reduced pollution
- Enhanced safety
   Location of services
- User comfort

### ATIS ELEMENTS

- · Traffic and transit data collection
- Data processing
- Data dissemination
- Data reception
- User interface devices
- Road network map data bases
- Route selection and guidance capabilities
- Vehicle location system
- Ancillary services

# ATIS CAN PROVIDE INFORMATION ABOUT

Traffic conditions

Traffic incidents

Road conditions

Weather

Transit schedules

Additional "yellow pages" type information:

· hotels, restaurants, theatres

· hospitals, police

· tourist attractions

### ATIS ACTIVITIES

- · Japan early developer of in-vehicle high end systems
- European demonstration of infrastructure based systems
  - US demonstrations of in-vehicle systems:
- Smart Corridor Los Angeles
- Travtek Orlando
- · Advance Chicago
- IVHS America working on architectures and standards
  - Industry marketing low end/cost systems
- Industry developing supporting technologies
- Ontario developing advanced, low cost system

# TYPICAL HIGH END IN-VEHICLE SYSTEM

In-dash system

· 2 way data communications

Vehicle location capability

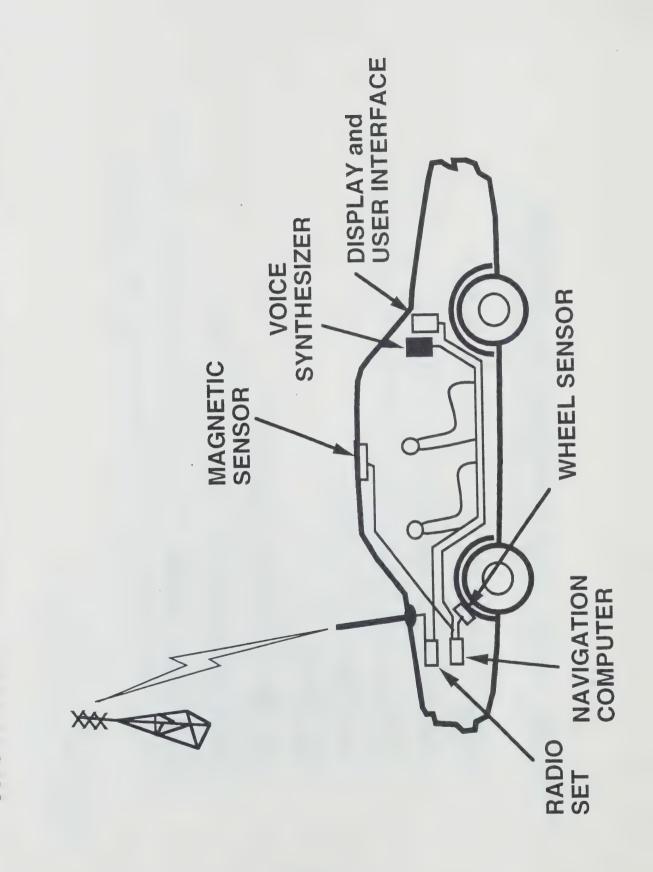

Route guidance capability

Colour CRT

CD-ROM based map data base

Computer/processor

• Cost: \$3000 - \$5000

## TYPICAL LOW-END SYSTEM

· Hand-held pager-type data receiver

Simple LCD display

Congestion information provided on limited routes

• Cost: \$100-\$300

# ONTARIO'S TRAVELGUIDE CONCEPT

Portable computer-based device

No location capability

Route guidance provided

· Traffic and transit info provided

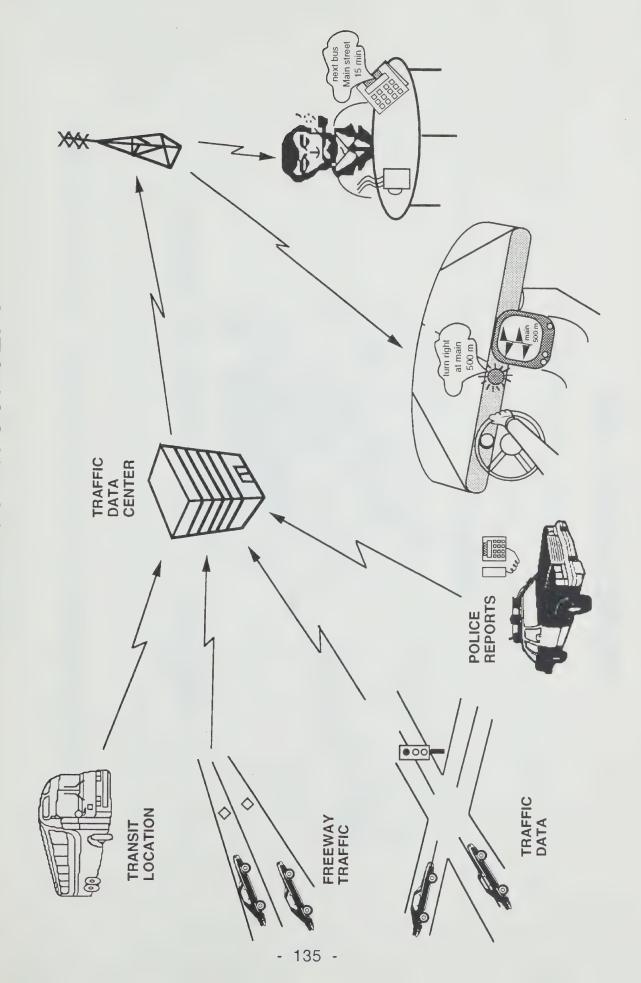

Voice based instructions to driver

LCD map displays

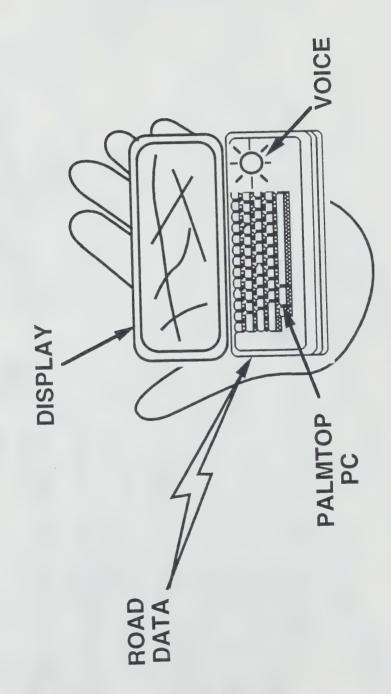

TravelGuide to work anywhere in North America

• Cost: \$500

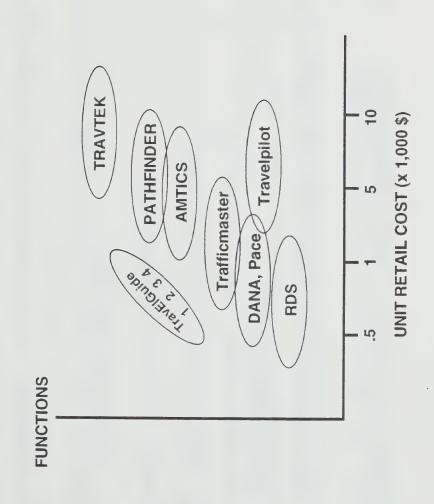

### TRAVELGUIDE CONCEPT

### TRAVELGUIDE UNIT

# COST/BENEFIT OF EXISTING ATI SYSTEMS

# TRAVELGUIDE PLANS - TWO PHASES

Development and limited Toronto demonstration Phase I -

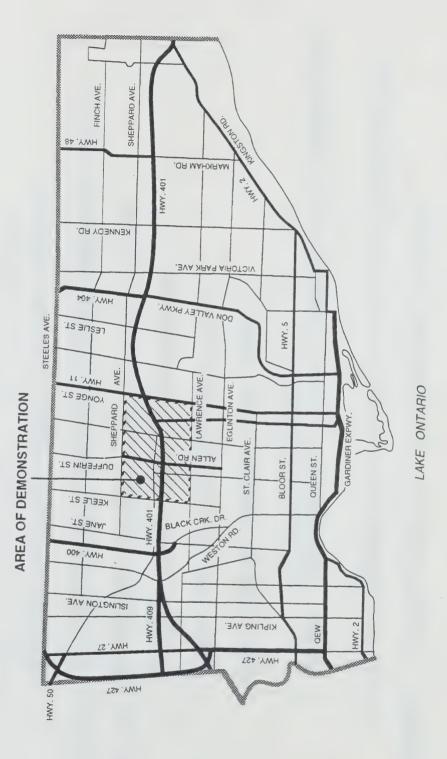

Phase II - Commercialization

## TRAVELGUIDE PLANS (cont)

# PHASE I - DEVELOPMENT AND DEMONSTRATION

- Ministry to develop data collection and processing system:
- MTIPS Metropolitan Toronto Transportation Information Production System
- TTC data for arterial travel times
- FTMS data for freeway travel times
- · Incident information from police, etc.
- · Above combined to yield link travel times
- Success not guaranteed, testing under way
- Ministry to provide data for demonstration

### METROPOLITAN TORONTO

## **TRAVELGUIDE PLANS - Phase I (cont)**

- Private sector in cooperation with Ministry to develop:
- Communications
- Portable equipment
- Map data base
- · Routing and other software
- Other jurisdictions interested in participation

# TRAVELGUIDE PLANS - Phase I (cont)

- Issue Request for Partnership Proposal (RFPP)
- Private/Public partnerships envisioned
- Ministry to develop data collection, processing system
- Private sector to develop/assist with development of:
- communications
- · hand-held unit
- map data base
- portable unit hardware
- system integration
- Finish with evaluation and assessment

## TRAVELGUIDE PLANS (cont)

### PHASE II - COMMERCIALIZATION

- Predicated upon successful demonstration
- Ministry to collect and provide Metro data
- Private sector to sell service and equipment to public
- Service providers to pay for data
- Other cities may participate
- · Geographic coverage may be enlarged
- Extend system to other cities

### **NEXT STEPS**

Ministry planning to issue RFPP in September

Responses due in October

Demonstration completed in Summer 1993

### BORDER CROSSING IMPROVEMENTS

- Speed border crossing operations at Windsor/Detroit and Sarnia/Port Huron
  - cargos/trucks
  - truck drivers
  - electronic toll collection
  - link between 401 and I-75
  - Participants
    - Ontario, Michigan
    - Transport Canada, FHWA
    - Customs, Immigration
    - Bridge, Tunnel operators
    - Trucking Associations
    - Customs Brokers
    - Status
      - Agreement in principle to proceed
      - Hiring consultants to look at institutional issues

### IVHS APPLICATION OPPORTUNITIES AT THE BORDERS

- Automatic toll collection at bridges and tunnel
  - AVI Tag/Smartcards
- Automated customs clearance of commercial vehicles/cargos
  - AVI Tag/Smartcards
- Automated immigration clearance for pre-screened truck drivers
  - Smartcards
- Automated customs and immigration clearance for pre-screened commuters
  - Smartcards
- Other innovative and creative solutions related to the border crossing operations
  - Information sharing and system integration

### IMPLEMENTATION STRATEGY

- Staging
  - Phase I: Institutional Impact Study (1992)
  - Phase II: Planning and Design (1992/93)
  - Phase III: Demonstration and Testing (1993/94)
- System Integration
  - Among agencies and operators
  - Link between Hwy 401 and I-75
  - Commercial vehicles first, private vehicles next

9)	Evaluation of IVHS Corridor Projects and Test beds for Improving Hazard Info Systems		\$0.75 M		3 years
10)	Motor Carrier Outreach Videos and Outreach Materials		\$0.1 M		1 year
11)	Truck Specific Dynamic Warning Systems		\$0.6 M		2 years
12)	Improved Weigh-In-Motion Systems		\$0.5 M		2 years
13)	IVHS Systems for Intermodal Freight Transportation		\$0.6 M		2 years

## ADVANCED PUBLIC TRANSPORTATION SYSTEMS (APTS)

## Overview and Opportunities

Barry R. Pekilis

### What is APTS?

technological solutions to enhance all modes of public transportation including transit and ridesharing. The APTS initiative provides for governments, universities, and industry to apply innovative

### Why APTS?

- Safety
- Reduce congestion
- Enhance mobility
- Minimize environmental impact
- Save energy
- Increase productivity

More effective use and management of public dollars in response to reduced funding and scarcer resources.

### How Will APTS Evolve?

- Standardization
- Public/private partnerships
- Cooperation at all levels of government
- Federal, Provincial, and Municipal
- Research & Development
- public, private, and joint ventures

### **Major Focus of APTS**

- 1) Market Development
- pre-trip planning, integrated fare media, mobility manager
- 2) Customer Interface
- public information, in-vehicle systems, electronic fares
- 3) Vehicle Operations and Communications
- AVL, data, software
- 4) High Occupancy Vehicle (HOV) Facilities Operation
- · regulation, automatic guidance

## Major APTS Technologies

- Automatic vehicle location/control
- Communications (voice/data)
- Smartcards
- Palmtops, notebooks
- Audio/video
- Image processing
- Data processing/computers/networks

# Major APTS Technologies (cont'd)

- Software
- the "glue" that ties the hardware together
- Financial
- cashless transactions, electronic funds transfer, security

### Areas for Participation

- Systems integrators
- prime contractors
- assume responsibility and risks
- Suppliers and manufacturers
- all types of technology and systems
  - standards drive/driven by
- Software development
- applicationsinterface
- maintenance

### B.P./92-44-021/APTS

# Areas for Participation (cont'd)

- Consultants
- ability to mix available technology and public transportation needs and requirements
- Financial institutions
- clearing house for transit funds
- accounting, audit, transfers, facilities, security
- Associations/Trade Groups
- Canadian Urban Transit Association
- American Public Transit Association

# **APTS-related Ontario Projects Under Way**

- 1) AVL/C for small and medium Ontario transit properties
- Automatic on-line scheduling for specialized transit 7
- 3) Area-wide Ridesharing service in the GTA
- Robotic Bus Chassis cleaning using AVI 4
- 5) Automated maintenance feasibility study
- OC Transpo AVLC, 560, on-street signage (9
- 7) TTC/Metro Toronto signal preemption
- 8) Ajax smartcard demonstration
- 9) GO Transit ticket vending machines

### APTS - A Final Word

# TECHNOLOGY ALONE IS NOT THE ANSWER

if public transit is to meet the needs of society into the practical management of capital and human resources Innovation and technology must be combined with the

21st century.
